

CONNECTING FIBER TO A HOME

Curious how we install fiber to your home? This diagram will give you an idea of what to expect during your construction period. TCT buries fiber conduit underground to your location, also known as the drop. We place a splice case on the outside of the home and run fiber from this point to our indoor ONT. From the ONT we will run CAT5 cable to a wireless router and optionally a switch that can provide service to additional wall jacks.
